```

date: 1995/05/18 08:04:54; author: mws; state: Exp; lines: +2 -2
Release Target: euterpe/verilog/bsrc

uu/uu.V euterpe.status: Generalize possibility of interrupt halfway through register writes of src!=dst GGFMul to allow NB load data return preempt to satisfy dependency of only the 2nd high half of a GGFMul source register pair. Create a hole in GGFMul's repel state to do this. The april95 version of the nbusemul_0 test noticed in case7. Placement still OK.

cj/cj.pim cj/genptab.pl ctioi/ctioi.pim ctioi/power.tab.local cust_intf.wkz: Power up CI RAM read index 5:0 (ifp 9:4) from f8s to f12s per recent analysis. Also add pad tick to write enable skew margin. Power up CTI RAM read index from f4s to f24s per recent analysis.

{at,cdio,cj,ctiod,gt,lt,nb,rg,sr}/genptab.pl: \ {au,cc,cp,es,hz,icc,ife,mc,uu}/power.tab.local: Specify tau (and when present, eta) phase so TOpt can check not that new version of TOpt mandates it.

ctiod/ctiod.V: Shell style comment illegal in verilog. Cdio, ctiod, .V and .pim changes in bsrc BOM's 306.5 and 306.4 were fixing hr/tau phase errors in the hz to cdio strNdx path; while at it making ctiod receiver of same hr too so all paths now 2 ticks. Euterpe.V was coreq but not in BOMs.

euterpe.V: Remove stale >>>'s per thr request.

euterpe.status: Add silly logic note on CTIOD tau/eta usage. Add note on "a" wires leaving HZ for heavy loads but also srcing local logic. Add note on GTLB NB priority for cache maintenance. Add note on BGate(I) updates of privilege level relative to GTLB permissions. Add notes on I & D write/read conflicts and resolution thereof. Fix notes on illegal sub-octlet stores.

cust_intf.wkz: Update D cache/tag style to be like I; add read data wire
delay to read margin formula (a 3 ps nit). Overhaul GTLB, especially
write cycle as old formulas thought all inputs had the same setup time
and were to be treated as 2 tick paths and did not get benefit of multi-
cycle setup controlled by the GI block. Make up some limits on write
enable delay, which DTag violates a little and GTLB massively.
-----
revision 304.6

Shows data cache read access margin is -32 (it's 32 pS over, for
2 cycle read at 926pS) and data tag read access margine is +63.

Topt would compute these numbers as -39, and +55 due to a more
pessimistic RC wire delay.

Note: I am not changing any sizes or layout, just the info
(and formulae) in this spread sheet.

    to satisfy dependency of only the 2nd high half of a GGFmul source register
    pair. Create a hole in GGFmul's repel state to do this. The april95 version
    of the nbusemul_0 test noticed in case7. Placement still OK.
cj/cj.pim cj/genptab.pl ctioi/ctioi.pim ctioi/power.tab.local cust_intf.wkz:
    Power up CI RAM read index 5:0 (ifp 9:4) from f8s to f12s per recent analysis.
    Also add pad tick to write enable skew margin.
    Power up CTI RAM read index from f4s to f24s per recent analysis.
{at,cdio,cj,ctiod,gt,lt,nb,rg,sr}/genptab.pl: \
{au,cc,cp,es,hz,icc,ife,mc,uu}/power.tab.local: Specify tau (and when present,
    eta) phase so TOpt can check not that new version of TOpt mandates it.
ctiod/ctiod.V: Shell style comment illegal in verilog. Cdio, ctiod, .V and
    .pim changes in bsrc BOM's 306.5 and 306.4 were fixing hr/tau phase errors
    in the hz to cdio strNdx path; while at it making ctiod receiver of same hr
    too so all paths now 2 ticks. Euterpe.V was coreq but not in BOMs.
euterpe.V: Remove stale >>>'s per tbr request.
euterpe.status: Add silly logic note on CTIOD tau/eta usage.
    Add note on "a" wires leaving HZ for heavy loads but also srcing local logic.
    Add note on GTLB NB priority for cache maintenance.
    Add note on BGate(I) updates of privilege level relative to GTLB permissions.
    Add notes on I & D write/read conflicts and resolution thereof.
    Fix notes on illegal sub-octlet stores.
